

SRXL

Signal receiver and processor for IF and L-band

Description

The SRXL is a mezzanine board that pairs with a PCI / PCIe main board to accept simultaneous RF inputs in the L-band range of 925 to 2175 MHz and the IF range of 65 to 225 MHz.

Each input is processed with a tunable quadrature down-converter. The resulting baseband I and Q signals are low-pass filtered and digitized with 12-bit precision at programmable sample rates up to 65 MHz.

The resulting four sample data streams are available as inputs to the Xilinx Spartan 3 FPGA, which is programmable to perform signal processing or to serve as a configurable switch matrix to route data to the main board and two Graychips (GC4016), each with four digital down-converters.

The main board supplies DMA, plus additional memory and programmable FPGA resources.

Features
